

# Mouse GM-CSF Bioactivity Data

(Catalog # 300-308P)

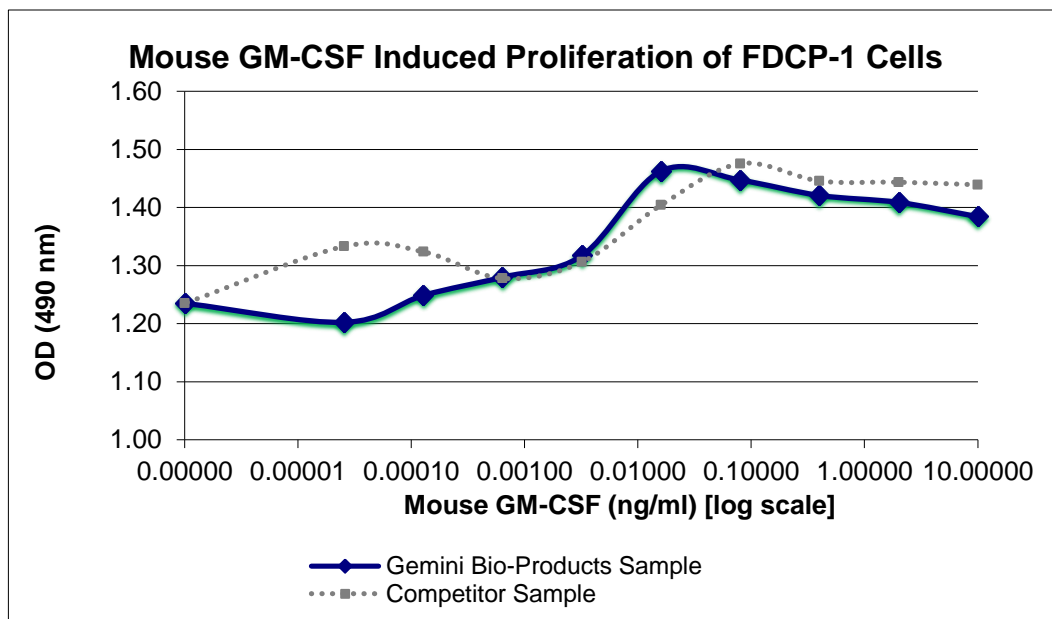

Figure: Serial dilutions of Mouse GM-CSF, starting at 10 ng/mL, were added to FDCP-1 cells. After 91 hours, cell proliferation was measured and the linear portion of the curve was used to calculate the ED<sub>50</sub>.

The ED<sub>50</sub> of Mouse GM-CSF is **3-5 pg/mL**.

This value is comparable to the typical expected range of less than 10 pg/mL.
